

Lecture 1: Basics in C++

Johannes Gerstmayr and Markus Walzthöni

Material: Jonas Kusch and Martina Prugger
University of Innsbruck

October 1, 2023

CV:

- studied Mechatronik, JKU Linz
- PhD Technical Mechanics
- Professor at Department of Mechatronics/UIBK since 2014
- Speaker of Research Center Computational Engineering

Research:

- Multibody System Dynamics
- Computational methods, finite elements, time integration
- Leading open source project Exudyn (C++ / Python)
- past: HOTINT, contributions to Netgen

CV:

- studied Computer Science in Innsbruck
- PhD Computer Science in Innsbruck (aborted)
- Engineer at Institute for Computer Science in Innsbruck
- external lecturer

Learning goals of this course: You will be able to

- ☐ write and compile efficient code in C++
- ☐ understand and use standard datatypes
- ☐ use IO functionalities
- ☐ understand and use pointers (memory)
- ☐ use the debugger
- ☐ use and implement libraries
- ☐ write object-oriented code

Learning goals of this course: You will be able to

- ☐ write and compile efficient code in C++
- ☐ understand and use standard datatypes
- ☐ use IO functionalities
- ☐ understand and use pointers (memory)
- ☐ use the debugger
- ☐ use and implement libraries
- ☐ write object-oriented code

Today's learning goals: You will be able to

- ☐ understand main advantages and disadvantages of C++
- ☐ set up your project with VS code
- ☐ write and compile your own first code with C++
- ☐ use libraries, print outputs to terminal
- ☐ learn about types

- ☐ understand and use standard datatypes
- ☐ use IO functionalities
- ☐ understand and use pointers (memory)
- ☐ use the debugger
- ☐ use and implement libraries
- ☐ write object-oriented code

Today's learning goals: You will be able to

- ☐ understand main advantages and disadvantages of C++
- ☐ set up your project with VS code
- ☐ write and compile your own first code with C++
- ☐ use libraries, print outputs to terminal
- ☐ learn about types

Ask questions any time!

What we expect from you

- Programming is not a spectators sport. You learn by writing code.
- *Exercises during course*, hand in exercises via olat by Wednesday in the next week.
- *Programming project*
 - groups of three
 - use UIBK gitlab, everyone should work with git / have commits
 - presentation of code
 - topic of project will be presented later

The screenshot shows the Olat course interface. At the top, there is a navigation bar with the course title '2023S198705 VU C und C++ in der Simulationsentwicklung'. Below this, there is a toolbar with icons for Administration, Status (PUBLISHED), Course info, Course search, Role (OWNER), and My course. On the left side, there is a sidebar with a list of items: '2023S198705 VU C und C++', 'Mural (digital white board)', 'Slides', 'Folder', and 'Exercises (upload)'. The main content area is titled 'Exercises (upload)' and shows a 'Groups' dropdown menu. Below the dropdown, it says '21 Entries'. At the bottom, there is a table with columns: Username, First name, Last name, E-mail, Drop box, Last modified, Return box, Last modified, and Action. The table is currently empty.

Why C++? - Simple stencil code

Python

```
for i in arange(1,N-1):
    for j in arange(1,N-1):
        out[j+i*N] = inn[j+i*N] \
                    + alpha*(inn[j-1+i*N] - 2.0*inn[j+i*N] + inn[j+1+i*N])
```

Wall time (2nd order): 9.5 s

C++

```
for(int i=1;i<N-1;i++)
    for(int j=1;j<N-1;j++)
        out[j+i*N] = in[j+i*N]
                    + alpha*(in[j-1+i*N] - 2.0*in[j+i*N] + in[j+1+i*N]);
```

Wall time (2nd order): 0.0028 s

Drastic performance improvement ($\approx 3000\times$).

- Reduces run time from say 1h to 1s.

Python is an **interpreted language**.

- A program, the interpreter, reads the python code and executes one statement after another.

C++ is a **compiled language** that uses a two-step approach

- **Compilation:** A program, the compiler, reads the C++ code and translates it into machine code.
- **Execution:** The machine code is directly executed by the CPU.

In reality Python uses an intermediate representation (bytecode).

Compilation

Can we compile Python?

```
x = 3 # x is a integer
if condition:
    x = 3.0 # x is a floating point number
y = 2*x
```

What operation should $2*x$ be compiled to?

- integer multiplication
- floating point multiplication

Compiler would need to understand all possible types that x can have.

- For an interpreted language this is much simpler (can be decided during run time)

In C++ type information need to be specified at compile time.

- Having type information available makes optimizing the machine code easier.

Performance

Fourth order stencil in Python

```
for i in arange(1,N-1):
    for j in arange(1,N-1):
        out[j+i*N] = inn[j+i*N] + alpha*(-1./12.*inn[j-2+i*N] \
            + 4./3.*inn[j-1+i*N] - 5./2.*inn[j+i*N] + 4./3.*inn[j+1+i*N] \
            - 1./12.*inn[j+2+i*N]);
```

Wall time (2nd order): 9.5 s

Wall time (4th order): 15.4 s

Fourth order stencil in C++

```
for(int i=1;i<N-1;i++)
    for(int j=2;j<N-2;j++)
        out[j+i*N] = inn[j+i*N] + alpha*(-1./12.*in[j-2+i*N]
            + 4./3.*in[j-1+i*N] - 5./2.*in[j+i*N] + 4./3.*in[j+1+i*N]
            - 1./12.*in[j+2+i*N]);
```

Wall time (2nd order): 0.0028 s

Wall time (4th order): 0.0028 s

Performance and use

In Python using the second order method is 1.6x faster than fourth order method. In C++ the second and fourth order methods take the same time.

- Performance is limited by fetching data from memory and not by the number of arithmetic operations the CPU can perform.

Writing a Python code to predict the performance of a C++ code is a bad idea!

Role of Python: Many software packages have embraced a high-level Python interface.

Python used to specify the problem but all the heavy lifting is done under the hood (usually in C++).

Makes the software approachable for users while maintaining good performance.

Today's learning goals: You will be able to

- ☒ understand main advantages and disadvantages of C++
- ☐ set up your project with VS code
- ☐ write and compile your own first code with C++
- ☐ use libraries, print outputs on terminal
- ☐ learn about types

Today's learning goals: You will be able to

Download Visual Studio Code

Free and built on open source. Integrated Git, debugging and extensions.

The image shows the Visual Studio Code download page layout. It features three main columns for Windows, Linux, and Mac. Each column has a platform icon at the top, a blue button with a download icon and the platform name, and a list of available installers or packages with their respective architectures.

Platform	Available Packages
Windows	User Installer (x64, x86, Arm64), System Installer (x64, x86, Arm64), .zip (x64, x86, Arm64), CLI (x64, x86, Arm64)
Linux	.deb (x64, Arm32, Arm64), .rpm (x64, Arm32, Arm64), .tar.gz (x64, Arm32, Arm64), Snap (Snap Store), CLI (x64, Arm32, Arm64)
Mac	.zip (Intel chip, Apple silicon, Universal), CLI (Intel chip, Apple silicon)

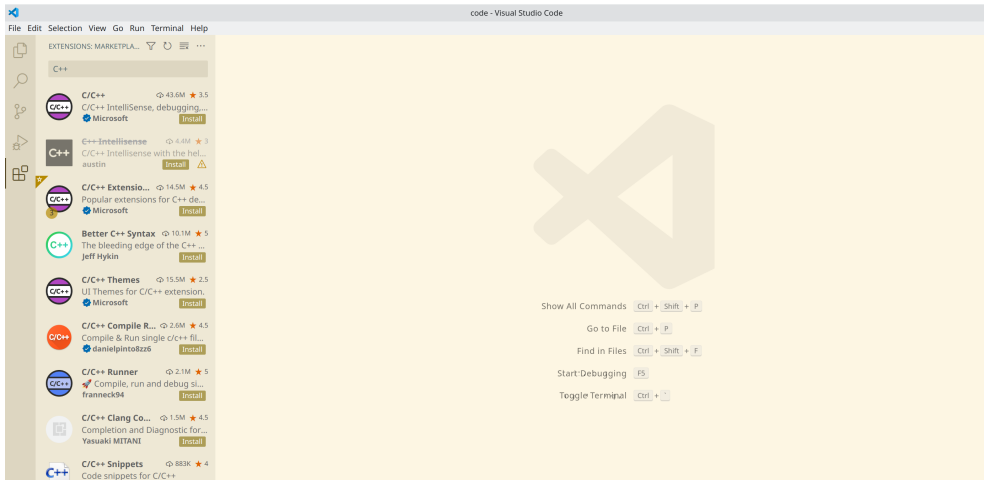

```
sudo apt install ./code_1.76.0-1677667493_amd64.deb
```

Set up VS code

Today's learning goals: You will be able to

- ☒ understand main advantages and disadvantages of C++
- ☒ set up your project with VS code
- ☐ write and compile your own first code with C++
- ☐ use libraries, print outputs on terminal
- ☐ learn about types

Today's learning goals: You will be able to

- ☒ understand main advantages and disadvantages of C++
- ☒ set up your project with VS code
- ☐ write and compile your own first code with C++
- ☐ use libraries, print outputs on terminal
- ☐ learn about types

Let's start with some code...

Let's start with some code...

```
1 #include <iostream> // header file library
2
3 int main(){          // main function is called when running code
4     std::cout << "Hello World!" << std::endl;    // print "Hello World!"
5     return 0;        // return terminates the program
6 }
```

We recall:

- comments are added by `// comment`
- start by including libraries (iostream for printing output)
- main instructions inside `int main(){ program code }`
- print output by `std::cout << "...",` end line with `std::endl`
- every command must be ended with `;`
- end program with `return 0;`

Compiling code

```
1 $ g++ -o hello.out main.cpp
```

The compiler goes through your source code to

- check if the code has the correct syntax
- does optimizations on the provided code structure
- translate the code into instructions readable by the computer
- generates the executable `hello.out` which you can run with

```
1 $ ./hello.out
```

Compiling code

```
1 $ g++ -o hello.out main.cpp
```

The compiler goes through your source code to

- check if the code has the correct syntax
- does optimizations on the provided code structure
- translate the code into instructions readable by the computer
- generates the executable `hello.out` which you can run with

```
1 $ ./hello.out
```

- ✓ We will revisit the detailed mechanism of the compiler today and later in the semester. For now, let us play around with what we learned.

Now it's up to you...

Task

Write a program which outputs $\sin(2)$ in the terminal.

Hint 1: The `sin` function is included in the `cmath` library.

Hint 2: To print a number with `cout` you do not need the quotation marks.

Now it's up to you...

Task

Write a program which outputs $\sin(2)$ in the terminal.

Hint 1: The sin function is included in the `cmath` library.

Hint 2: To print a number with `cout` you do not need the quotation marks.

Recall

```
1 #include <iostream> // header file library
2
3 int main(){          // main function is called when running code
4     std::cout << "Hello World!" << std::endl;    // print "Hello World!"
5     return 0;        // return terminates the program
6 }
```

Now it's up to you...

Task

Write a program which outputs $\sin(2)$ in the terminal.

Hint 1: The sin function is included in the `cmath` library.

Hint 2: To print a number with `cout` you do not need the quotation marks.

Solution

```
1 #include <iostream> // library includes cout, endl
2 #include <cmath> // library includes sin
3
4 int main(){
5     std::cout << sin(2.0) << endl;
6     return 0
7 }
```

Now it's up to you...

Task

Write a program which outputs $\sin(2)$ in the terminal.

Hint 1: The sin function is included in the `cmath` library.

Hint 2: To print a number with `cout` you do not need the quotation marks.

Solution

```
1 #include <iostream> // library includes cout, endl
2 #include <cmath> // library includes sin
3
4 int main(){
5     std::cout << sin(2.0) << std::endl;
6     return 0;
7 }
```

A simple IO library

The `fstream` library can be used to read/write data from and to files.

```
1 #include <iostream>
2 #include <fstream> // library to read/write data
3
4 int main(){
5     double tmp1, tmp2;
6     std::fstream in("input.txt"); // specify input file
7
8     in >> tmp1; // read first value
9     in >> tmp2; // read second value
10    std::cout<<tmp1<<" "<<tmp2<<std::endl;
11
12    return 0;
13 }
```

A simple IO library

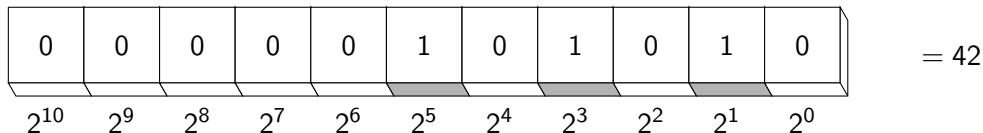

The `fstream` library can be used to read/write data from and to files.

```
1 #include <iostream>
2 #include <fstream> // library to read/write data
3
4 int main(){
5     std::ofstream out("result.txt"); // specify output file
6
7     out<<1.0<<" " <<2.2<<std::endl; // write values
8
9     return 0;
10 }
```

Today's learning goals: You will be able to

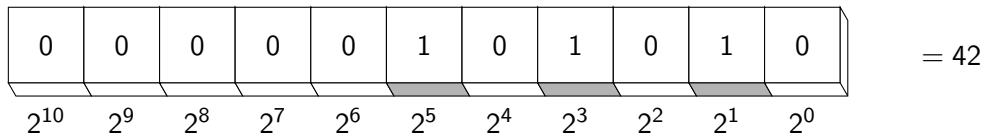

- ✓ understand main advantages and disadvantages of C++
- ✓ set up your project with VS code
- ✓ write and compile your own first code with C++
- ✓ use libraries, print outputs on terminal
- learn about types

What are types and why do we need them?

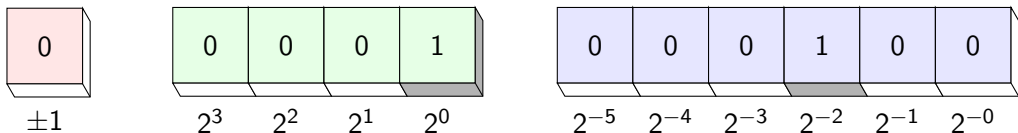

- Numbers are represented by bits.
- Integers usually use 16 bits (−32768 to 32767)

What are types and why do we need them?

- Numbers are represented by bits.
- Integers usually use 16 bits (-32768 to 32767)

- Real numbers: **sign** · **mantissa** · 2^{exponent}
- double uses 64 bits

What are types and why do we need them?

- Whenever possible, we would like to tell the program how many bits we need.
- Remember that the C++ compiler requires us to define the type in advance

```
x = 3 # x is a integer
if condition:
    x = 3.0 # x is a floating point number
y = 2*x
```

- Types simplify readability.
- Main types are: char, string, int, long, double

Code example

```
1 int main(){
2     int i; // declaration
3     i = 2; // definition
4     double d = 2.3; // declaration and definition
5     double a = 1.0, b = 2.3;
6     return 0;
7 }
```

- Tell compiler that only 16 bits will be needed for *i* and 64 bits are needed for *a*, *b*, *d*.
- Good practice to declare variables at beginning.

Code example

```
1 int main(){  
2     int i; // declaration  
3     i = 2; // definition  
4     double d = 2.3; // declaration and definition  
5     double a = 1.0, b = 2.3;  
6     return 0;  
7 }
```

- Tell compiler that only 16 bits will be needed for *i* and 64 bits are needed for *a*, *b*, *d*.
- Good practice to declare variables at beginning.

Exercise

Besides the `cout` and `endl` commands that you have already seen, the `iostream` library also offers the `cin` command to read inputs from the command line via `cin >> INPUT;`. Write a program which asks the user to provide a number of type `double` and returns the `sin` of this value.

Now it's up to you...

```
1 #include <iostream>
2 #include <cmath>
3
4 int main(){
5     double input;
6     std::cout<<"Enter a number: ";
7     std::cin >> input;
8     std::cout<<std::endl<<"sin("<<input<<" ) = "<<sin(input)<<std::endl;
9     return 0;
10 }
```

Now it's up to you...

```
1 #include <iostream>
2 #include <cmath>
3
4 int main(){
5     double input;
6     std::cout<<"Enter a number: ";
7     std::cin >> input;
8     std::cout<<std::endl<<"sin("<<input<<" ) = "<<sin(input)<<std::endl;
9     return 0;
10 }
```

Exercise

Read in an integer and a double and print out the sum of these two values.

Now it's up to you...

```
1 #include <iostream>
2
3 int main(){
4     double inputInt;
5     double inputDouble;
6     std::cout<<"Enter two numbers: Integer ";
7     std::cin >> inputInt;
8     std::cout<<", Double ";
9     std::cin >> inputDouble;
10    int sum = inputInt + inputDouble;
11    std::cout<<"sum is "<<sum<<std::endl;
12    return 0;
13 }
```

Now it's up to you...

```
1 #include <iostream>
2
3 int main(){
4     double inputInt;
5     double inputDouble;
6     std::cout<<"Enter two numbers: Integer ";
7     std::cin >> inputInt;
8     std::cout<<" , Double ";
9     std::cin >> inputDouble;
10    int sum = inputInt + inputDouble;
11    std::cout<<"sum is "<<sum<<std::endl;
12    return 0;
13 }
```

- Accuracy usually higher as sum is a double.
- use typecast double sum = double(inputInt) + inputDouble

Now it's up to you...

```
1 #include <iostream>
2
3 int main(){
4     double inputInt;
5     double inputDouble;
6     std::cout<<"Enter two numbers: Integer ";
7     std::cin >> inputInt;
8     std::cout<<" , Double ";
9     std::cin >> inputDouble;
10    double sum = inputInt + inputDouble;
11    std::cout<<"sum is "<<sum<<std::endl;
12    return 0;
13 }
```

- Accuracy usually higher as sum is a double.
- use typecast double sum = double(inputInt) + inputDouble

Vector

- There are more datatypes, which are implemented in standard C++ libraries. Let's start with `std::vector`

```
1 #include <iostream>
2 #include <vector>
3
4 int main(){
5     std::vector<double> v{1, 2, 3};
6     v[2] = 1.0;
7     std::cout<<v[0]<<" "<<v[1]<<" "<<v[2]<<std::endl;
8     return 0;
9 }
```

- Note that you need to put an `std::` in front of the vector (and `cout`, `endl`). This is a namespace which we will cover later.
- indexing starts at 0 in C++!
- `size`, `reserve`, `resize`

Today's learning goals: You will be able to

- ✓ understand main advantages and disadvantages of C++
- ✓ set up your project with VS code
- ✓ write and compile your own first code with C++
- ✓ use libraries, print outputs on terminal
- ✓ learn about types

The compiler

- We write code that humans understand but computers can't.
⇒ translate into machine language
- The main tools are the *compiler* and the *linker*.
- *compiler*: C++ code into machine language file (object file, `main.o`, `main.obj`)
- *linker*: combine obj files and libraries (precompiled code)

```
1      $ g++ -c hello.cpp
2      $ g++ -o hello.out hello.o
3      $ ls
4      hello.cpp  hello.o  hello.out
5
```

We will revisit the compiler multiple times once our programs become more complicated.

Your turn

Task

Write a program which generates two vector $v_1 = [0, 0.5, 1]$ and $v_2 = [0, \sin(0.1), 1]$ of type float. Generate a third vector $v_3 = v_1 + v_2$.

Now it's up to you...

Current learning goals: After homework and self-study

- ✓ understand main advantages and disadvantages of C++
- ✓ set up your project with VS code
- ✓ write and compile your own first code with C++
- ✓ use libraries, print outputs to terminal (`iostream`, `cmath`, `fstream`, `cout`)
- ✓ learn about types (`int`, `double`, `vector`,...)

Now it's up to you...

Current learning goals: After homework and self-study

- ✓ understand main advantages and disadvantages of C++
- ✓ set up your project with VS code
- ✓ write and compile your own first code with C++
- ✓ use libraries, print outputs to terminal (`iostream`, `cmath`, `fstream`, `cout`)
- ✓ learn about types (`int`, `double`, `vector`,...)

Now it's up to you...

Current learning goals: After homework and self-study
